& ATMOSPHERIC SCIENCE

# Introduction

- There is a need to estimate value of forecasts
- Agriculture can benefit from forecasts
- Farm decisions include government policies and regulations
- Few studies addressed impacts of Farm Programs to forecasts value (Mjelde et al., 1996; Bosch, 1984)
- Knowledge gap between synergies and conflicts between Farm Programs and forecasts value

# Objective/Hypothesis

- **Estimate impacts of Farm Programs on the value of ENSO forecasts in a maize-cotton-peanut rainfed farm located in Jackson Co., FL**
- **Government interventions might enhance or limit the usefulness of the climate information**

# M&M Representative Farm

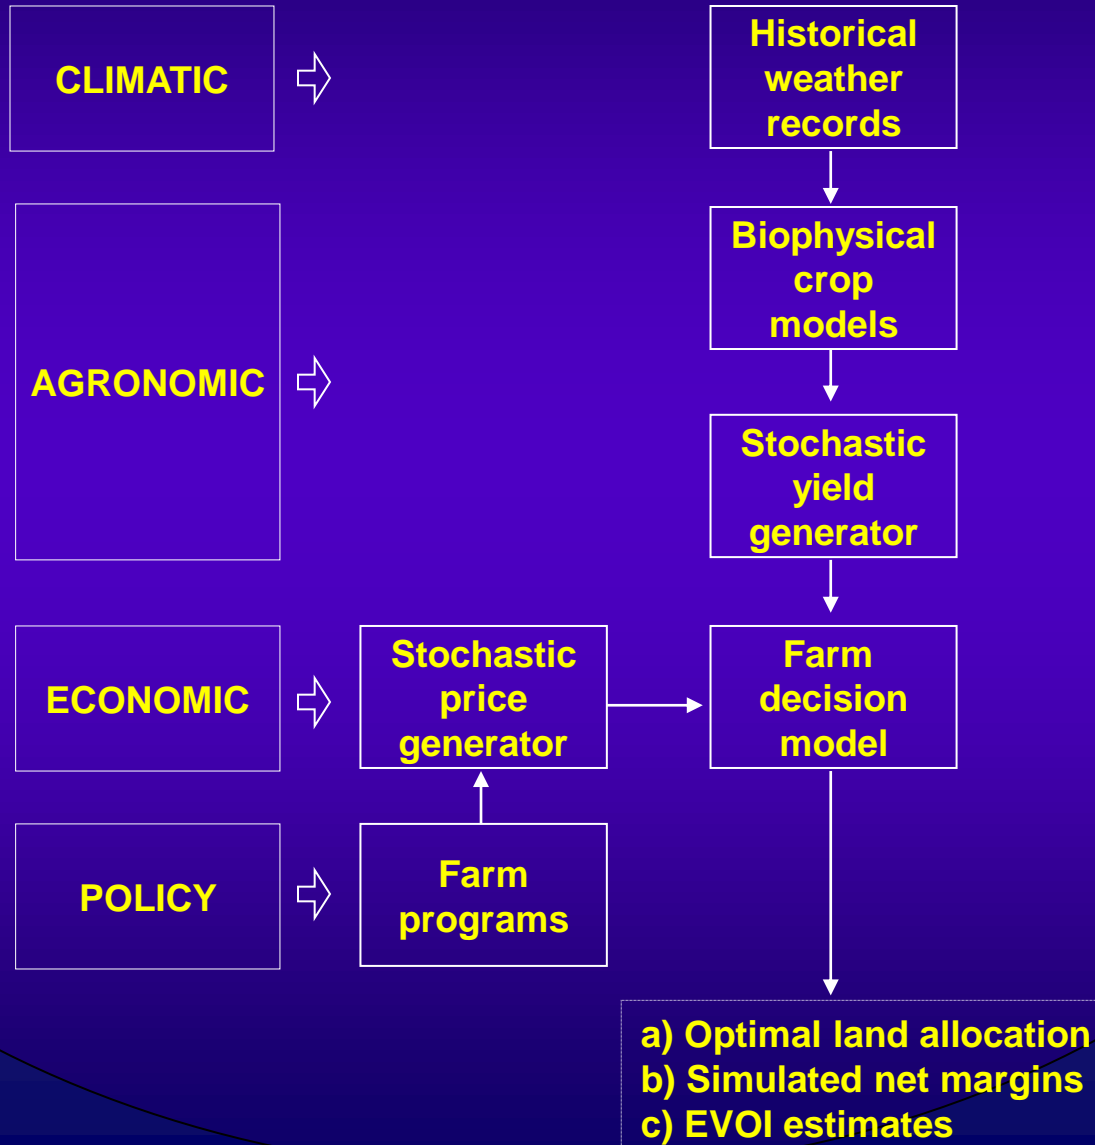

- 128.7 ha farm with soils type *Dothan Loamy Sand*
- Rainfall = 1466 (1143) mm
- T = 19.3 (21.7) °C
- ENSO intra-phase variability impacts crop yields with considerable overlap
- E.g., higher peanut yields early La Niña or late El Niño plantings

# M&M Representative Farm

# M&M The Jackson Model

# M&M Agronomic Component Crop Yield Simulation

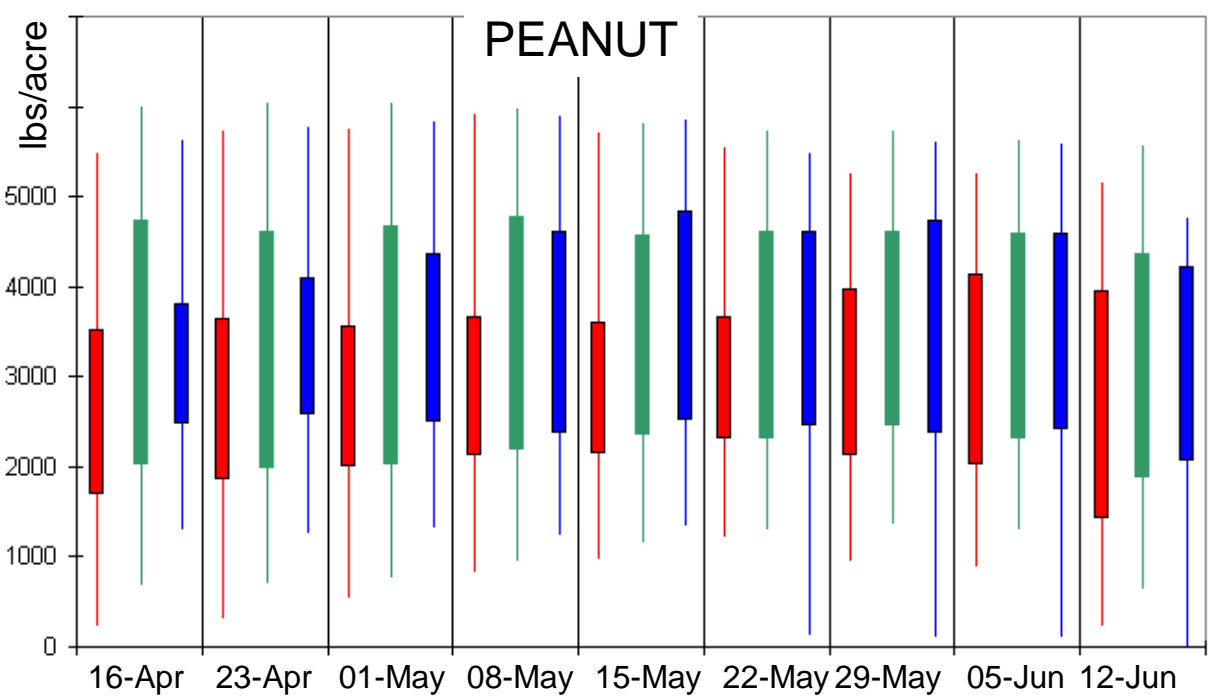

- **Chiplew weather station (30.783N, 85.483W)- 65 yr records (1939-2003)**
- **14 El Niño, 16 La Niña phases**
- **DSSAT crop simulations (Jones et al., 2003)**
- **Contemporary and local practices of varieties, fertilization, and planting dates (H.E. Jowers, pers. comm.)**

# M&M Agronomic Component Synthetic Yield Generation

- Needed more ENSO realizations
- Stochastic yield generator (990 yr x ENSO phase)
- Re-sampling technique:
  - Sort simulated yields
  - Function to fit a curve
  - Re-sampling function
  - Repeated for each planting date, each crop, in each ENSO phase

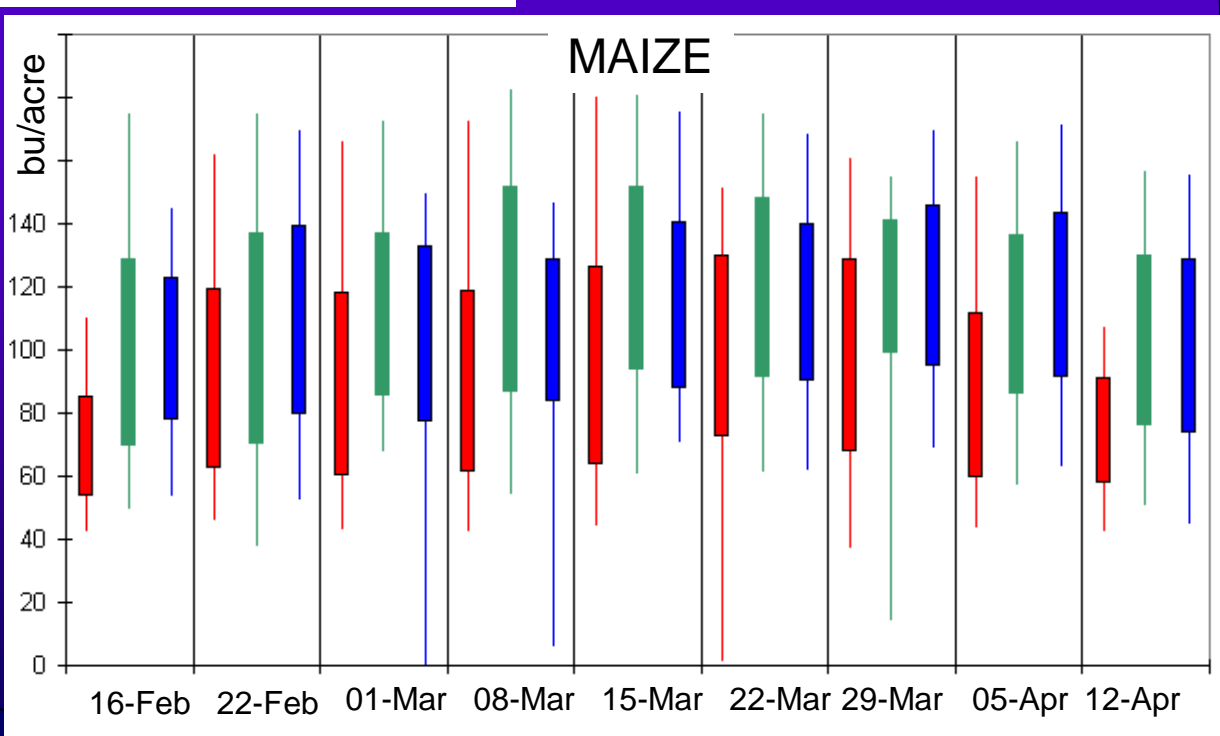

# Synthetic Yields

**El Niño** ■

**Neutral** ■

**La Niña** ■

# M&M Economic Component Synthetic Price Generation

- 2970 price series to match our yields
- Multivariate distribution respecting price covariance among crops based on historical price variability
- Jan96-Jan05 USDA prices, deflated, detrended, decomposed, separated and sampled, back transformed, validated, and seasonally adjusted

# M&M Economic Component Whole Farm Model

- **Stochastic non-linear optimization and simulation model**
- **325 yr sample for optimizations, all 2970 yr for simulations**
- **MINOS5 algorithm GAMS (Gill et al. 2000)**
- **Constant Relative Risk of Aversion (Rr) of 0, 0.5, 1, 2, 3, 4 (Hardaker et al., 2004)**

# M&M Economic Component Optimization Model

$$\max_x E\{U(W_f)\} = \sum_{n=1}^N \sum_{i=1}^3 q_i U(W_0 + \Pi_{i,n}) / N \quad (1)$$

$$\sum_{m=1}^{22} X_m = 1; X_m \geq 0 \quad (2)$$

$$\sum_{j=1}^{10} X_m * L_{m,j} \leq \bar{L}_j \quad (3)$$

$$U(W_f) = W_f^{1-R_r} / (1 - R_r) \quad (4)$$

# M&M Economic Component

## Estimated Value of Information

- Net margins 2970 yr (990 x ENSO phase)
  - $EVOI = \text{Net Margin With Forecast} - \text{Net Margin Without Forecast}$
  - $EVOI = \text{certainty equivalent units (US\$) over different planning horizons}$
  - Repeated for each  $R_r$
- 

# M&M Policy Component Commodity Loan Programs

- **Commodity Loan Programs are based on actual production and do not require decision before planting**
- **The 1996 FAIR Farm Act set LDP of \$1.14 kg<sup>-1</sup> for cotton**
- **The 2002 FSRFA Farm Act set MLB of \$0.39 kg<sup>-1</sup> for peanut and \$0.08 kg<sup>-1</sup> for maize**

# M&M Policy Component Synthetic Price Distribution

**MLB is marketing loan benefit. LDP is loan deficiency payment. \*Price of cotton is \$100 kg<sup>-1</sup>**

# M&M Policy Component

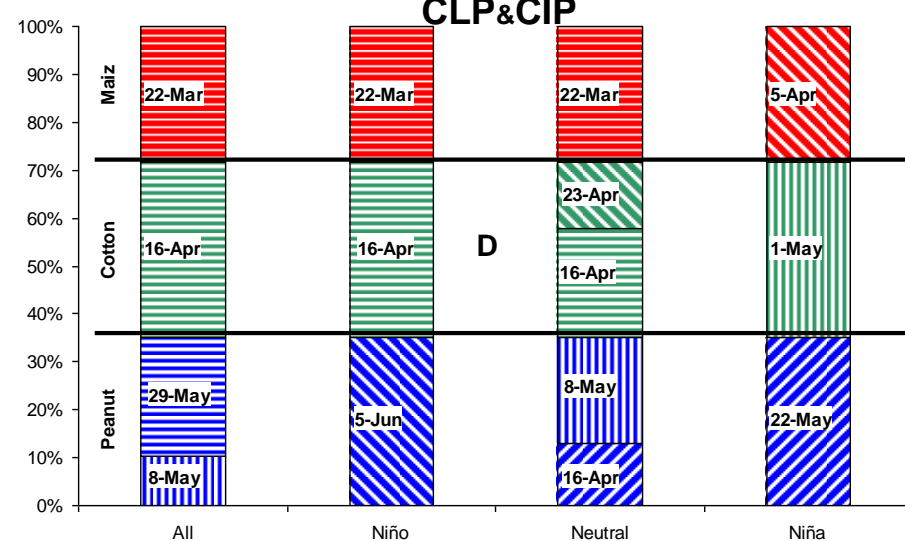

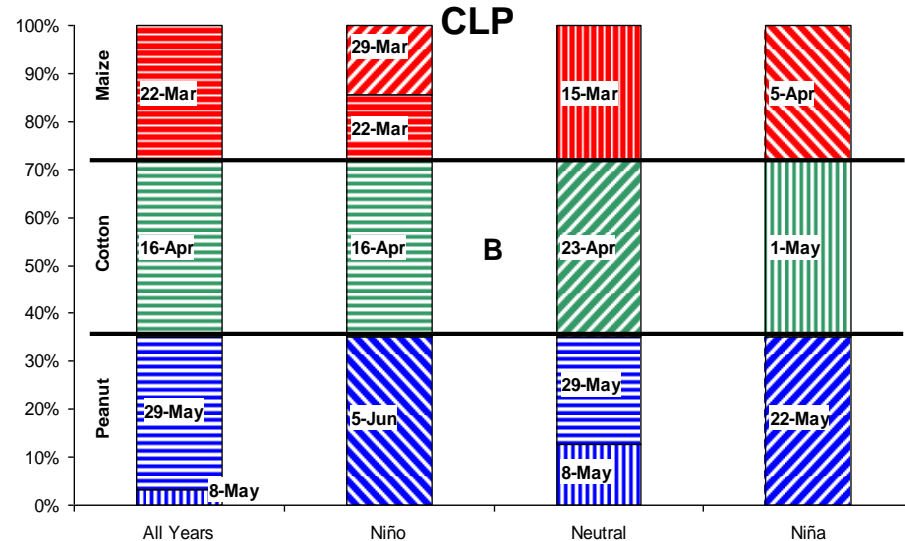

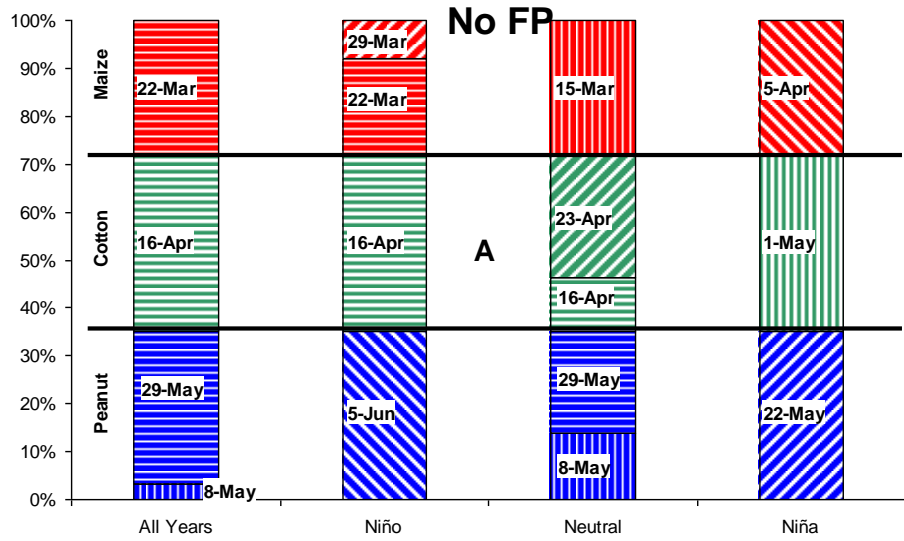

## Crop Insurance Programs

- **Most common crop insurance product by crop in Jackson County (2004)**
  - Peanut 70% MPCI, 0.3935 \$ kg<sup>-1</sup>
  - Cotton 65% CRC, 1.4991 \$ kg<sup>-1</sup>
  - Maize 50% MPCI, 0.0964 \$ kg<sup>-1</sup>
- **Premiums added to variable costs**
- **Indemnity payments added to objective function**

# Findings Optimal Land Allocation

# Findings Distribution of EVOI

100-year horizons,  $R_r = 1$ , Mean=4.39, 95%CI=[3.48, 5.30]

# Findings EVOI without FP

# Findings EVOL with CLP

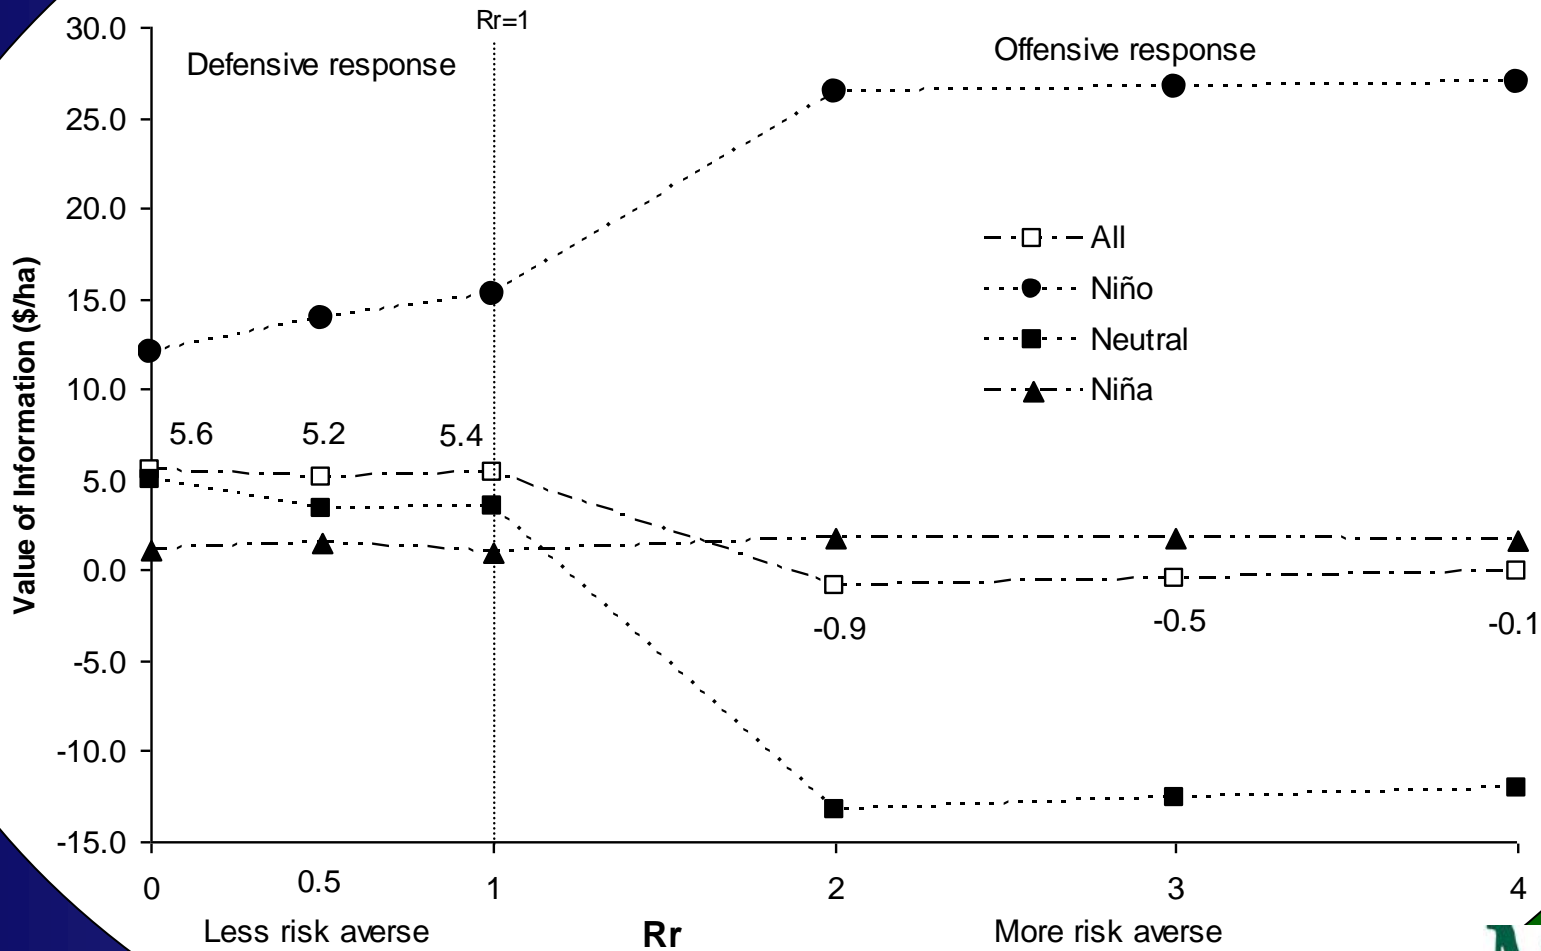

# Findings EVOI with CIP

# Findings EVOI with CLP & CIP

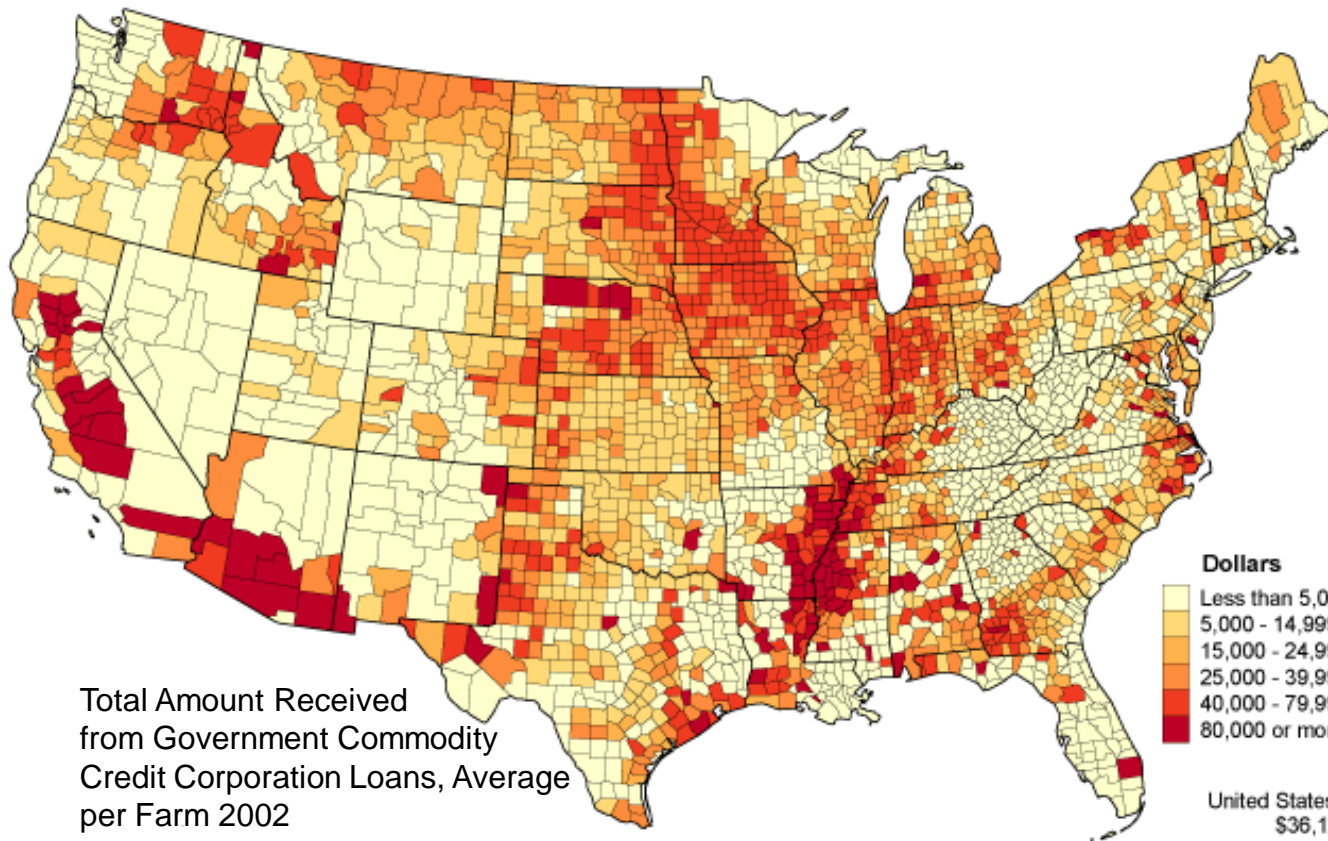

# Conclusions

- **Forecast value is inherently probabilistic**
- **Negative value of information exists and is not negligible**
- **As hypothesized, Farm Programs impact substantially EVOI**
- **CLP & CIP decrease EVOI**
- **Further research: synthetic weather generator, other locations: AL, GA**

# Thanks
